

**Statement MS Drycare and biogas units**

22<sup>nd</sup> of may 2017

In practice and after calculation the following statement can be made:

The levels of product exposed to the total volume in the manure pit will normally be very low and not interfere in the pH of the manure. Based on the biodegradability of our Ms Drycare it will be highly unlikely/can be excluded that a negative effect on the fermentation process in the biogas unit will be noticed.

With regard to biodegradability and toxicology we would like to refer to the Material Safety Data Sheets. Confirmation of the abovementioned can also be abstracted from the toxicological and ecological chapters (according EC legislation)

With kind regards

Harrie Schippers
